## **I. Introduction:**

The total dose radiation test plan for the MSK5810RH series was developed to qualify the devices as Radiation Hardened to 300 Krad(Si). The testing was performed beyond 300 Krad(Si) to show trends in device performance as a function of total dose. The test does not classify maximum radiation tolerance of the device, but simply offers designers insight to the critical parameter-shifts up to the specified total dose level. The MSK5800RH, MSK5810RH, MSK5820RH, MSK5821RH, MSK5822RH, and MSK5827RH all use the same active components. The data in this report is from direct measurement of the MSK5810RH response to irradiation but it is indicative of the response of all five device types and is applicable to all five types.

MIL-STD-883 Method 1019.7 and ASTM F1892-06 were used as guidelines in the development and implementation of the total dose test plan for the MSK5810RH.

## **II. Radiation Source:**

Total dose was performed at the University of Massachusetts, Lowell, using a Cobalt 60 radiation source. The dose rate was determined to be 117.4 Rad(Si)/sec. The total dose schedule can be found in Table I.

## **III. Test Setup:**

All test samples were subjected to Group A Electrical Test at 25°C in accordance with the device data sheet. In addition, all devices received 160 hours of burn-in per MIL-STD-883 Method 1015. For test platform verification, one control device was tested at 25°C. Ten devices were then tested at 25°C, prior to irradiation, and were found to be within acceptable test limits.

The devices were vertically aligned with the radiation source and enclosed in a lead/aluminum container during irradiation. Five devices were biased during irradiation. Maximum recommended operating voltage of +7.5V was used for the bias condition. Five devices had all leads grounded during irradiation for the unbiased condition.

After each irradiation, the device leads were shorted together and transported to the MSK automatic electrical test platform and tested IAW MSK device data sheet. Testing was performed on irradiated devices, as well as one control device, at each total dose level. All electrical tests were completed within one hour of irradiation. Each subsequent dose was performed within two hours of the previous irradiation.

## **IV. Data:**

All performance curves are averaged from the test results of the biased and unbiased devices, respectively. If required, full test data can be obtained by contacting Anaren Inc. – MSK Products.

## **V. Summary:**

Based on the test data recorded during radiation testing and statistical analysis, Feedback Voltage, Shutdown Threshold, Shutdown Hysteresis and Output Current Limit exhibited shift due to irradiation, however all performance curves stayed within specification beyond 300 Krad(Si) TID.

## I. Introduction:

The total dose radiation test plan for the MSK5810RH series was developed to qualify the devices as RAD Hard to 300 KRAD (Si). The testing was performed beyond 300 KRAD (Si) to show trends in device performance as a function of total dose. The test does not classify maximum radiation tolerance of the device, but simply offers designers insight to the critical parameter-shifts up to the specified total dose level. The MSK5800RH, MSK5810RH, MSK5820RH, MSK5821RH, MSK5822RH, and MSK5827RH all use the same active components. The data in this report is from direct measurement of the MSK5810RH response to irradiation but it is indicative of the response of all five device types and is applicable to all five types.

MIL-STD-883 Method 1019.7 and ASTM F1892-06 were used as guidelines in the development and implementation of the total dose test plan for the MSK5810RH.

## II. Radiation Source:

Total dose was performed at the University of Massachusetts, Lowell, using a Cobalt 60 radiation source. The dose rate was determined to be 126.7 Rads(Si)/sec. The total dose schedule can be found in Table I.

## III. Test Setup:

All test samples were subjected to Group A Electrical Test at 25°C in accordance with the device data sheet. In addition, all devices received 160 hours of burn-in per MIL-STD-883 Method 1015. For test platform verification, two control devices were tested at 25°C. Ten devices were then tested at 25°C, prior to irradiation, and were found to be within acceptable test limits.

The devices were vertically aligned with the radiation source and enclosed in a lead/aluminum container during irradiation. Five devices were biased during irradiation. Maximum recommended operating voltage of +7.5V was used for the bias condition. Five devices had all leads grounded during irradiation for the unbiased condition.

After each irradiation, the device leads were shorted together and transported to the MSK automatic electrical test platform and tested IAW MSK device data sheet. Testing was performed on irradiated devices, as well as two control devices, at each total dose level. The time to complete electrical tests exceeded 1 hour at the 100krad(Si) and 150krad(Si) dose levels due to test equipment malfunctions. Electrical tests were completed within one hour of irradiation at 300krad(Si) and 450krad(Si). Devices were subjected to subsequent radiation doses within two hours of removal from the radiation field at all test points.

## IV. Data:

All performance curves are averaged from the test results of the biased and unbiased devices, respectively. If required, full test data can be obtained by contacting Anaren Inc. – MSK Products.

## V. Summary:

Based on the test data recorded during radiation testing and statistical analysis, Feedback Voltage, Shutdown Threshold, Shutdown Hysteresis and Output Current Limit exhibited shift due to irradiation, however all performance curves stayed within specification beyond 300 Krad(Si) TID.

## **I. Introduction:**

The total dose radiation test plan for the MSK 5810 RH series was developed to qualify the devices as RAD Hard to 300 KRAD (Si). The testing was performed beyond 300 KRAD (Si) to show trends in device performance as a function of total dose. The test does not classify maximum radiation tolerance of the device, but simply offers designers insight to the critical parameter-shifts up to the specified total dose level. The MSK 5800RH, MSK5810RH, MSK5820RH, MSK5821RH, MSK5822RH, and MSK5827RH all use the same active components. The data in this report is from direct measurement of the MSK5810RH response to irradiation but it is indicative of the response of all five device types and is applicable to all five types.

MIL-STD-883 Method 1019.7 and ASTM F1892-06 were used as guidelines in the development and implementation of the total dose test plan for the MSK 5810RH.

## **II. Radiation Source:**

Total dose was performed at the University of Massachusetts, Lowell, using a cobalt 60 radiation source. The dose rate was determined to be 151 Rads(Si)/sec. The total dose schedule can be found in Table I.

## **III. Test Setup:**

All test samples were subjected to Group A Electrical Test at 25°C in accordance with the device data sheet. In addition, all devices received 320 hours of burn-in per MIL-STD-883 Method 1015. For test platform verification, two control devices were tested at 25°C. Ten devices were then tested at 25°C, prior to irradiation, and were found to be within acceptable test limits.

The devices were vertically aligned with the radiation source and enclosed in a lead/aluminum container during irradiation. Five devices were biased during irradiation. Maximum recommended operating voltage of +7.5V was used for the bias condition. Five devices had all leads grounded during irradiation for the unbiased condition.

After each irradiation, the device leads were shorted together and transported to the MSK automatic electrical test platform and tested IAW MSK device data sheet. Testing was performed on irradiated devices, as well as the control device, at each total dose level. Electrical tests were completed within one hour of irradiation. Devices were subjected to subsequent radiation doses within two hours of removal from the radiation field.

## **IV. Data:**

All performance curves are averaged from the test results of the biased and unbiased devices, respectively. If required, full test data can be obtained by contacting Anaren Inc. – MSK Products.

## **V. Summary:**

Based on the test data recorded during radiation testing and statistical analysis, Feedback Voltage, Shutdown Threshold, and Shutdown Hysteresis exhibited shift due to irradiation, however all performance curves stayed within specification beyond 300 Krad(Si) TID.

A Line Regulation data point was an outlier at 300 Krad(Si) but was within family at 100 Krad(Si) and 450 Krad(Si). We can conclude that this was a testing error and therefore removed the data point from the analysis.

## I. **Introduction:**

The total dose radiation test plan for the MSK 5810 RH series was developed to qualify the devices as RAD Hard to 300 KRAD (Si). The testing was performed beyond 300 KRAD (Si) to show trends in device performance as a function of total dose. The test does not classify maximum radiation tolerance of the device, but simply offers designers insight to the critical parameter-shifts up to the specified total dose level. The MSK 5800RH, MSK5810RH, MSK5820RH, MSK5821RH, MSK5822RH, and MSK5827RH all use the same active components. The data in this report is from direct measurement of the MSK5810RH response to irradiation but it is indicative of the response of all five device types and is applicable to all five types.

MIL-STD-883 Method 1019.7 and ASTM F1892-06 were used as guidelines in the development and implementation of the total dose test plan for the MSK 5810RH.

## II. **Radiation Source:**

Total dose was performed at the University of Massachusetts, Lowell, using a cobalt 60 radiation source. The dose rate was determined to be 158 Rads(Si)/sec. The total dose schedule can be found in Table I.

## III. **Test Setup:**

All test samples were subjected to Group A Electrical Test at 25°C in accordance with the device data sheet. In addition, all devices received 320 hours of burn-in per MIL-STD-883 Method 1015. For test platform verification, one control device was tested at 25°C. Ten devices were then tested at 25°C, prior to irradiation, and were found to be within acceptable test limits.

The devices were vertically aligned with the radiation source and enclosed in a lead/aluminum container during irradiation. Five devices were biased during irradiation. Maximum recommended operating voltage of +7.5V was used for the bias condition. Five devices had all leads grounded during irradiation for the unbiased condition.

After each irradiation the device leads were shorted together and transported to the MSK automatic electrical test platform and tested IAW MSK device data sheet. Testing was performed on irradiated devices, as well as the control device, at each total dose level. Electrical tests were completed within one hour of irradiation. Devices were subjected to subsequent radiation doses within two hours of removal from the radiation field.

## IV. **Data:**

All performance curves are averaged from the test results of the biased and unbiased devices, respectively. If required, full test data can be obtained by contacting Anaren Inc. – MSK Products.

## V. **Summary:**

Based on the test data recorded during radiation testing and statistical analysis, the MSK5810RH qualified as a 300 KRAD (Si) radiation hardened device. Feedback Voltage, Shutdown Threshold, and Output Current Limit exhibited the most significant shift due to irradiation, however all performance curves stayed within specification up to 450 KRAD (Si) TID

## I. Introduction:

The total dose radiation test plan for the MSK 5810 RH series was developed to qualify the devices as RAD Hard to 300 KRAD (Si). The testing was performed beyond 300 KRAD (Si) to show trends in device performance as a function of total dose. The test does not classify maximum radiation tolerance of the device, but simply offers designers insight to the critical parameter-shifts up to the specified total dose level. The MSK 5800RH, MSK5810RH, MSK5820RH, MSK5821RH, MSK5822RH, and MSK5827RH all use the same active components. The data in this report is from direct measurement of the MSK5810RH response to irradiation but it is indicative of the response of all five device types and is applicable to all five types.

MIL-STD-883 Method 1019.7 and ASTM F1892-06 were used as guidelines in the development and implementation of the total dose test plan for the MSK 5810RH.

## II. Radiation Source:

Total dose was performed at the University of Massachusetts, Lowell, using a cobalt 60 radiation source. The dose rate was determined to be 93 Rads(Si)/sec. The total dose schedule can be found in Table I.

## III. Test Setup:

All test samples were subjected to Group A Electrical Test at 25°C in accordance with the device data sheet. In addition, all devices received 320 hours of burn-in per MIL-STD-883 Method 1015. For test platform verification, one control device was tested at 25°C. Ten devices were then tested at 25°C, prior to irradiation, and were found to be within acceptable test limits.

The devices were vertically aligned with the radiation source and enclosed in a lead/aluminum container during irradiation. Five devices were biased during irradiation. Maximum recommended operating voltage of +7.5V was used for the bias condition. Five devices had all leads grounded during irradiation for the unbiased condition.

After each irradiation the device leads were shorted together and transported to the MSK automatic electrical test platform and tested IAW MSK device data sheet. Testing was performed on irradiated devices, as well as the control device, at each total dose level. Electrical tests were completed within one hour of irradiation. Devices were subjected to subsequent radiation doses within two hours of removal from the radiation field.

## IV. Data:

All performance curves are averaged from the test results of the biased and unbiased devices, respectively. If required, full test data can be obtained by contacting M.S. Kennedy Corporation.

## V. Summary:

Based on the test data recorded during radiation testing, the MSK5810RH qualified as a 300 KRAD (Si) radiation hardened device. Feedback Voltage, Shutdown Threshold, and Output Current Limit exhibited the most significant shift due to irradiation, however all performance curves stayed within specification up to 450 KRAD (Si) TID

**I. Introduction:**

The total dose radiation test plan for the MSK 5810 RH series was developed to qualify the devices as RAD Hard to 300 KRAD (Si). The testing was performed beyond 300 KRAD (Si) to show trends in device performance as a function of total dose. The test does not classify maximum radiation tolerance of the device, but simply offers designers insight to the critical parameter-shifts up to the specified total dose level. The MSK 5800RH, MSK5810RH, MSK5820RH, MSK5821RH, MSK5822RH, and MSK5827RH all use the same active components. The data in this report is from direct measurement of the MSK5810RH response to irradiation but it is indicative of the response of all five device types and is applicable to all five types.

MIL-STD-883 Method 1019.7 and ASTM F1892-06 were used as guidelines in the development and implementation of the total dose test plan for the MSK 5810RH.

**II. Radiation Source:**

Total dose was performed at the University of Massachusetts, Lowell, using a cobalt 60 radiation source. The dose rate was determined to be 122 Rads(Si)/sec. The total dose schedule can be found in Table I.

**III. Test Setup:**

All test samples were subjected to Group A Electrical Test at 25°C in accordance with the device data sheet. In addition, all devices received 320 hours of burn-in per MIL-STD-883 Method 1015. For test platform verification, one control device was tested at 25°C. Ten devices were then tested at 25°C, prior to irradiation, and were found to be within acceptable test limits.

The devices were vertically aligned with the radiation source and enclosed in a lead/aluminum container during irradiation. Five devices were biased during irradiation. Maximum recommended operating voltage of +7.5V was used for the bias condition. Five devices had all leads grounded during irradiation for the unbiased condition.

After each irradiation the device leads were shorted together and transported to the MSK automatic electrical test platform and tested IAW MSK device data sheet. Testing was performed on irradiated devices, as well as the control device, at each total dose level. Electrical tests were completed within one hour of irradiation. Devices were subjected to subsequent radiation doses within two hours of removal from the radiation field.

**IV. Data:**

All performance curves are averaged from the test results of the biased and unbiased devices, respectively. If required, full test data can be obtained by contacting M.S. Kennedy Corporation.

**V. Summary:**

Based on the test data recorded during radiation testing, the MSK5810RH qualified as a 300 KRAD (Si) radiation hardened device. Feedback Voltage, Shutdown Threshold, and Output Current Limit exhibited the most significant shift due to irradiation, however all performance curves stayed within specification up to 450 KRAD (Si) TID

## I. Introduction:

The total dose radiation test plan for the MSK 5810 RH series was developed to qualify the devices as RAD Hard to 300 KRAD (Si). The testing was performed beyond 300 KRAD (Si) to show trends in device performance as a function of total dose. The test does not classify maximum radiation tolerance of the device, but simply offers designers insight to the critical parameter-shifts up to the specified total dose level. The MSK5800RH, MSK 5810RH, MSK5820RH, MSK5821RH, MSK5822RH, and MSK5827RH all use the same active components. The data in this report is from direct measurement of the MSK5810RH response to irradiation but it is indicative of the response of all five device types and is applicable to all five types.

MIL-STD-883 Method 1019.7 and ASTM F1892-06 were used as guidelines in the development and implementation of the total dose test plan for the MSK 5810RH.

## II. Radiation Source:

Total dose was performed at the University of Massachusetts, Lowell, using a cobalt 60 radiation source. The dose rate was determined to be 172 Rads(Si)/sec. The total dose schedule can be found in Table I.

## III. Test Setup:

All test samples were subjected to Group A Electrical Test at 25°C in accordance with the device data sheet. In addition, all devices received 320 hours of burn-in per MIL-STD-883 Method 1015. For test platform verification, one control device was tested at 25°C. Ten devices were then tested at 25°C, prior to irradiation, and were found to be within acceptable test limits.

The devices were vertically aligned with the radiation source and enclosed in a lead/aluminum container during irradiation. Five devices were kept under bias during irradiation. Maximum recommended operating voltage of +7.5V was used for the bias condition. Five devices had all leads grounded during irradiation for the unbiased condition.

After each irradiation the device leads were shorted together and transported to the MSK automatic electrical test platform and tested IAW MSK device data sheet. Testing was performed on irradiated devices, as well as the control device, at each total dose level. Electrical tests were completed within one hour of irradiation. Devices were subjected to subsequent radiation doses within two hours of removal from the radiation field.

## IV. Data:

All performance curves are averaged from the test results of the biased and unbiased devices, respectively. If required, full test data can be obtained by contacting M.S. Kennedy Corporation.

## V. Summary:

Based on the test data recorded during radiation testing, the MSK5810RH qualified as a 300 KRAD (Si) radiation hardened device. Feedback Voltage, Shutdown Threshold, and Output Current Limit exhibited the most significant shift due to irradiation, however all performance curves stayed within specification up to 450 KRAD (Si) TID.

**I. Introduction:**

The total dose radiation test plan for the MSK 5822 RH series was developed to qualify the devices as RAD Hard to 300 KRAD (Si). The testing was performed beyond 300 KRAD (Si) to show trends in device performance as a function of total dose. The test does not classify maximum radiation tolerance of the device, but simply offers designers insight to the critical parameter-shifts up to the specified total dose level.

MIL-STD-883 Method 1019.7 and ASTM F1892-06 were used as guidelines in the development and implementation of the total dose test plan for the MSK 5822 RH.

**II. Radiation Source:**

Total dose was performed at the University of Massachusetts, Lowell, using a cobalt 60 radiation source. The dose rate was determined to be 179 Rads(Si)/sec. The total dose schedule can be found in Table I.

**III. Test Setup:**

All test samples were subjected to Group A Electrical Test at 25°C in accordance with the device data sheet. In addition, all devices received 320 hours of burn-in per MIL-STD-883 Method 1015. For test platform verification, one control device was tested at 25°C. Ten devices were then tested at 25°C, prior to irradiation, and were found to be within acceptable test limits.

The devices were vertically aligned with the radiation source and enclosed in a lead/aluminum container during irradiation. Five devices were kept under bias during irradiation.
